

TEC (Peltier) Controller Control Software "PLC Controller.exe" Operating Manual (Rev.1.30)

[Software Version: 1.2.0.0]

Applicable Model	Hardware Version	Firmware Version	Remarks
PLC-15V6A	2.00 -	1.0.0.1 -	
PLC-24V6A	2.00 -	1.0.0.1 -	
PLC-24V10A	2.00 -	1.0.0.0 -	
PLC-24V10AL-PT	3.00 -	1.1.0.0 -	
PLC-24V10AL-TH	3.00 -	1.1.0.0 -	
PLP-300W14A	2.10 -	1.0.0.0 -	

[IMPORTANT]
 This software supports a product listed in the applicable model list.
 Support for this software is available on Kurag Electronics.
 If you have any questions, please contact Kurag Electronics Peltier Controller Support by E-mail.

1. Install

Create a new folder (ex: "PLC_Controller") on any place of the HDD and copy the software executable file "PLC Controller.exe" to that folder.

Operating Environment

Supported Operating System

- Microsoft Windows XP
- Microsoft Windows Vista (*1)
- Microsoft Windows 7 (*1)(*2)
- Microsoft Windows 8 / 8.1 (*1)(*2)
- Microsoft Windows 10 (*1)(*2)

(*1) When the software cannot start correctly, please try to set the Windows XP compatible mode in the properties window.

(*2) When the software is placed in the "Program Files" folder, the software may not start. In this case, please place the software in the folder other than "Program Files".

The following software environment is required to execute this software:

Microsoft .NET Framework 4

2. Uninstall

Delete the folder that was created at installation.

(*) The files, such as the setting files containing the temperature profile for the Program Mode that was saved by this software, are also deleted at same time.

3. Start and Exit

Start

In order to start this software, select the file of the "PLC Controller.exe" and execute it.

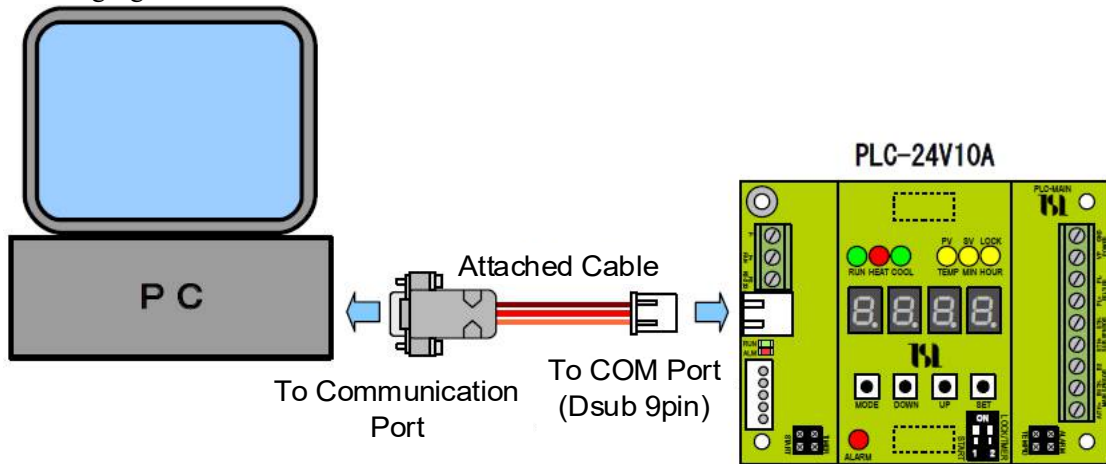

Exit

In order to exit this software, click the  Button on the right top of the window. The confirmation message is shown. Clicking the "Yes" Button exits this software.

(*) If the communication is online or the temperature control is running when exiting, the communication and the control will be terminated automatically then this software will exit.

4. Connection

Connect the Peltier Controller to a PC with the communication cable.
* Following figures show connection between PC and PLC-24V10A.

* Please use the Dsub 9 pin female - male straight connection cable to extend the cable.

If your PC does not have the Serial COM Port (RS-232), please use a USB - Serial Converter.

* USB-Serial conversion cable, please prepare the one with RS-232 connector Dsub male 9 pin.

* Please use the Dsub 9 pin female - male straight connection cable to extend the cable.

5. Start-up Screen

The following start screen is displayed after launching this software.
 Recommended screen resolution is horizontal 1280 pixels x vertical 720 pixels or more.

The screenshot shows the software interface for the PLC Controller, version 1.2.0.0. The interface is divided into several sections:

- Initial Section:** Contains a 'STATE' button, a 'Mode' dropdown menu (set to 'Manual Mode'), and a 'START' button.
- Run Section:** Contains a 'Port' dropdown menu (set to 'COM3') and an 'OPEN' button.
- Program Mode Section:** Contains a 'File Path' dropdown menu (set to 'C:\KE\PLC Controller\Program') and an 'OPEN' button.
- Data Acquisition Section:** Contains a 'CSV File Name' dropdown menu, an 'OPEN' button, and 'START' and 'STOP' buttons.
- Temperature Control Panel (Right Side):** Displays real-time data:
 - Current (PV): 00.0 °C
 - Setting (SV): 00.0 °C
 - Status: STOP
 - Buttons for COOL and HEAT
 - Timer: 0 M
 - Setting: 0 M
 - Status: CONT
 - Alarm: GOOD
- Configuration Panels (Middle Right):**
 - Temperature:** Includes 'Temperature Setting' and a 'SET' button.
 - Time:** Includes 'Timer Setting' and a 'SET' button.
 - Timer Run Mode:** Includes a 'Mode Setting' dropdown menu (set to 'Continuous').
 - Chart Range:** Includes a checked 'Auto' checkbox and 'Minimum' and 'Maximum' input fields.
- Main Display Area (Left):** Labeled 'Temperature [C]', it shows a large empty space for a temperature trace chart.

Callout boxes provide the following instructions:

- Initial Section:** Reload the current status. (* The status is updated automatically while running.)
- Run Section:** Start / Stop the temperature control. Click START button to start the temperature control. The button top will be changed to STOP.
- Program Mode Section:** Start / Stop the communication with PLC series. Select COM port number. and click "OPEN" button to start. The button top will be changed to "CLOSE".
- Data Acquisition Section:** Specify the save folder for temperature profile data of Program Mode.
- Data Acquisition Section:** Save measuring data. Specify the data file name. Start / Stop save.
- Initial Section:** Maximize / minimize window. Exit this software.
- Temperature Control Panel:** Display the current status.
- Configuration Panels:** Manual Mode screen: Configure the target temperature, timer and mode. Program Mode screen: Configure the temperature profile.
- Main Display Area:** Click the tab then the tab screen will switch. Manual Mode, Continuous / Timer mode, Program Mode.
- Main Display Area:** Temperature trace screen. Chart the time variation of the temperature.

6. Manual Mode

6-1. Continuous Mode

This mode can control the temperature continuously by setting the target temperature.

(5) Click START button then start the temperature control. The button top will be changed to STOP. Click STOP button then stop the temperature control.

(1) Click OPEN button when the communication is closed.

(3) Input the target temperature and click SET button.

If the Alarm is SENSOR, this displays "----".

(2) Click Manual Mode tab.

(4) Select Continuous.

Indicator upper limit (Dash / Orange)
* Disappear when lower = upper = 0.

Main sensor temperature (Solid / Green)

Target temperature (Solid / Red)

0°C line (Solid / Pink)

Indicator lower limit (Dash / Aqua)
* Disappear when lower = upper = 0.

Running status icon
Cool: ■ Blue
Heat: ■ Red

If the Alarm is SUBSNS, this displays "----".

Configure the vertical (temperature) scale of the temperature trace chart.
If Auto is checked, the scale is adjusted to cover the temperature control range automatically.
The scale can be adjusted manually by unchecking Auto and configuring the Minimum and Maximum.

The temperature trace chart is displayed after starting the temperature control.
The horizontal full scale is 10 minutes.
The chart will scroll automatically if the trace draws closer to the right side.

The target temperature can be specified in 0.1 °C step. If the value outside the available range is specified, an input error message as shown in the left image will be displayed. Please input correct value.

6-2. Timer mode

This mode can control the temperature only for the set time by setting the target temperature and time.

(6) Click START button then start the temperature control. The button top will be changed to STOP. Click STOP button then stop the temperature control.

(1) Click OPEN button when the communication is closed.

(3) Input the target temperature and click SET button.

(4) Input the time and click SET button. The selectable time unit is Min or Hour.

(2) Click Manual Mode tab.

Indicator upper limit (Dash / Orange)

Main sensor temperature (Solid / Green)

(5) Select "Timer".

Target temperature (Solid / Red)

Indicator lower limit (Dash / Aqua)

(7) The remaining time to the Timer finish is displayed.

The temperature trace chart is displayed. The horizontal scale (Time) varies according to Timer setting time.

Temperature indicator	
Within limits:	25.1
Over upper limit:	44.9
Under lower limit:	5.7

* When lower = upper = 0, the Indicator function is disabled.

The target temperature can be specified in 0.1 °C step. The timer time can be specified in 0.1 Min or 0.1 Hour step. If the value outside the available range is specified, an input error message as shown in the left image will be displayed. Please input correct value.

7. Program mode

This mode can control the temperature according to the temperature profile set in advance.

(CAUTION)
 If the temperature profile has a faster change than the performance of the in-use Peltier element, the Peltier element cannot chase the temperature profile.
 Please configure appropriate profile to match the performance of the in-use Peltier element.

(8) Click START button then start the temperature control.
 The button top will be changed to STOP.
 Click STOP button then stop the temperature control.

(1) Click OPEN button when the communication is closed.

(3) Specify the folder where the temperature profile data file exists. (See 7-1.)

(4) Open or save the temperature profile data. (See 7-2)

(2) Click Program Mode tab.

Indicator upper limit (Dash / Orange)

Starting date and time

(6) Specify Repeat setting (See 7-4.)

(7) Specify Finish Mode. (See 7-5.)

Target temperature (Solid / Red)

Main sensor temperature (Solid / Green)

Indicator lower limit (Dash / Aqua)

(9) Remaining time up to Program end is displayed.

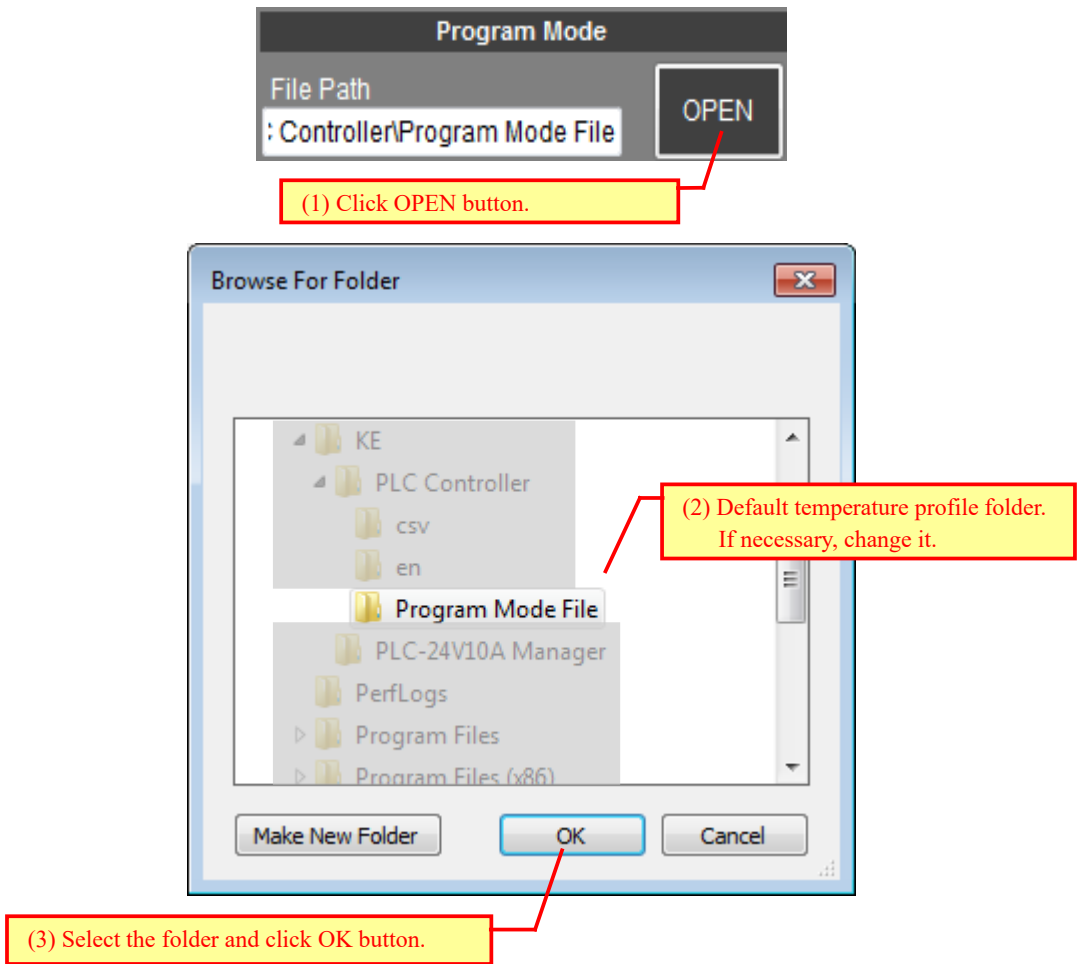

(5) Input the temperature profile. (See 7-3.)

The temperature profile chart and temperature trace chart are displayed.
 The horizontal scale (Time) varies according to profile total setting time.

(CAUTION)
The following procedure is required for the temperature control according to the temperature profile in Program Mode:
1) Input the temperature profile. (Input the temperature and time in figures.)
2) Save the temperature profile data to a file. (MEMORY to a file)
3) Read the temperature profile data from the above file. (OPEN from a file)
Please note that the profile data is not reflected only by inputting each value on the profile window.

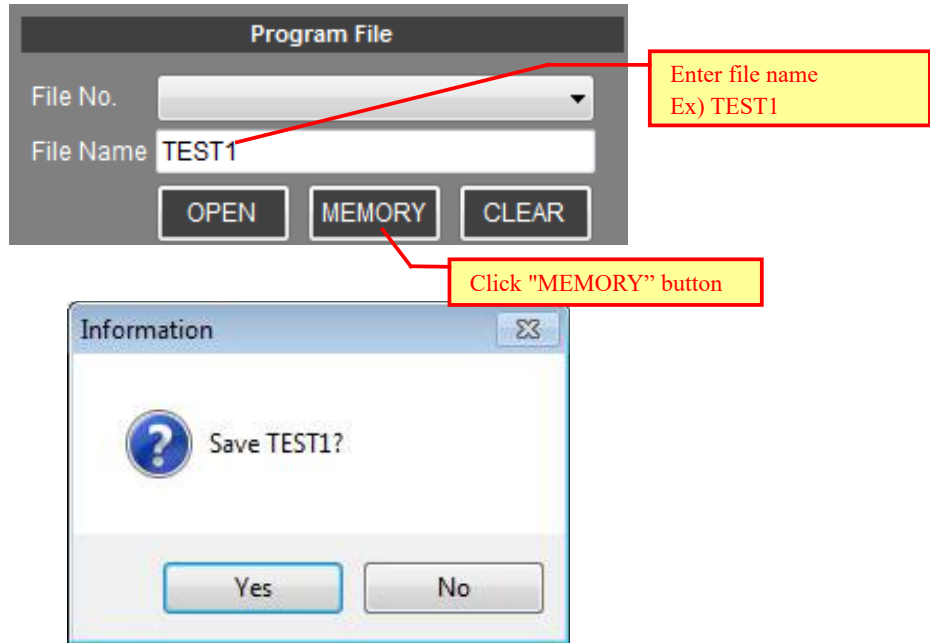

7-1. Folder location for the Temperature Profile Data

In default configuration, "Program Mode File" folder is created automatically under the parent folder where the executable file "PLC Controller.exe" was copied.
If necessary, change the temperature profile folder.

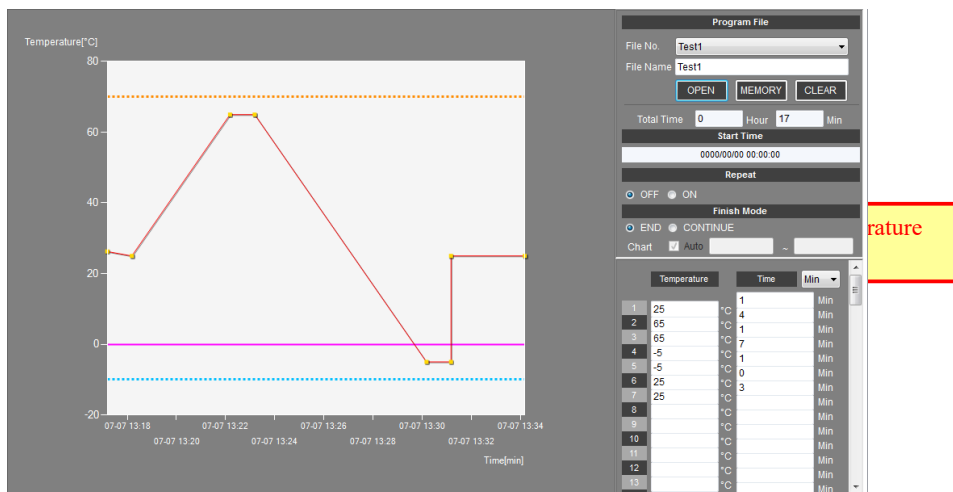

7-2. Open / Save of the Temperature Profile Data

To save the temperature profile setting, input the file name and click MEMORY button.

To load the temperature profile setting, select the file name from pull-down menu and click OPEN button.

7-3. Temperature Profile Setting

The temperature profile setting is accomplished by alternately input of temperature and time.

The screenshot shows the 'Program File' section with 'File No.' set to 'Test1'. Below are 'OPEN', 'MEMORY', and 'CLEAR' buttons. The 'Total Time' is displayed as 0 Hour and 17 Min. The 'Start Time' is 7/7/2017 1:21:28 PM. The 'Repeat' section has 'OFF' selected. The 'Finish Mode' has 'END' selected. A 'Chart' section has 'Auto' checked.

Step	Temperature (°C)	Time (Min)
1	25	1
2	65	4
3	65	1
4	-5	7
5	-5	1
6	25	0
7	25	3
8		
9		
10		
11		
12		
13		

Callout boxes provide the following instructions:

- The total setting time will be displayed.
- Select the unit of time. You can choose from seconds, minutes or hours. * Combinations of seconds, minutes, and hours can not be set.
- When program operation is started, the temperature of the first step is automatically set to the current temperature. It will change with the time set here for the target temperature set in STEP-1. * If the rapid temperature change of the temperature controlled object is undesirable, please set a longer time.
- Enter the target temperature of STEP-1.
- Enter the time to change from STEP-1 to STEP-2.
- Enter the target temperature of STEP-2.
- Enter temperature and time alternately.
- Specifying "0" for time instantly changes the target temperature.
- Please leave the input field blank after the last step.
- The maximum temperature profile step is 99.

The temperature can be specified in 0.1°C basis.
The time can be specified in a second, 0.1 minute or 0.1 hour basis.
If the value is out of range, the input error message as shown in the left image is displayed. Please input the correct value.

A zero cannot be specified consecutively in the Time input box.
If a zero is specified consecutively, the input error message as shown in the left image is displayed. Please input the correct value.

If the temperature is identical between consecutive STEPs, a zero cannot be specified in the corresponding Time input box.
If such temperature or time is specified, the input error message as shown in the left image is displayed. Please input the correct value.

[CAUTION]

After inputting all temperature profile data, that profile data must be saved to a file and that data must be re-loaded from the file.
Only these operation can fix the temperature profile and can make this profile data available for temperature control in the Program Mode.

7-4. Repeat Setting of the Temperature Profile

To execute the temperature profile iteratively, specify the Repeat setting.

7-5. Finish Mode of the Temperature Profile

To continue temperature control after the end of the temperature profile execution, configure the Finish Mode setting.

(*) If the Repeat setting is ON, this setting is ignored.

(*) The temperature trace chart after the end of the temperature profile execution is same as the Manual Mode.

(2) Configure the vertical (temperature) scale of the temperature trace chart.
If Auto is checked, the scale is adjusted to cover the temperature control range automatically.
The scale can be adjusted manually by unchecking.

8. Alarm indication

When the Peltier controller detects an error, the alarm indicator LED on both the main board and the display board of the Peltier controller blinks and the Peltier controller stops temperature control.

In addition, the Alarm status is displayed in the Alarm indicator area on this software.

(*) For the detail of the Alarm and Protection function, please refer to the manual of the Peltier controller.

Main Sensor Alarm

This alarm occurs when the main temperature sensor is not connected correctly.

Sub Sensor Alarm

This alarm occurs when the main temperature sensor is not connected correctly. (Applicable products only)

Current Alarm

This alarm occurs when the drive current through the Peltier element exceeds the limit set in advance.

Fan Alarm

This alarm occurs when the rotation stops more than 5 sec.
 (*) Only for the fan with a pulse sensor output.

Reverse Protection

This alarm occurs while the Reverse Protection is working.

Power Supply Alarm

This alarm occurs when the power supply voltage for the Peltier drive is abnormal. (Applicable products only)

Peltier Polarity Alarm

This alarm occurs when the Peltier device is connected in reversed polarity. (Applicable products only)

Peltier Alarm

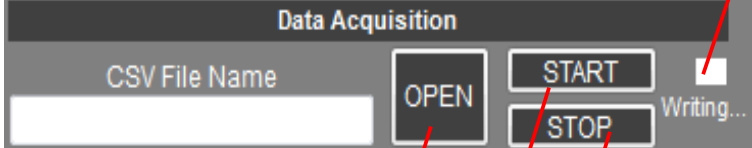

This alarm occurs when the Peltier drive current or voltage is unusual value. (Applicable products only)

[Caution]

Depending on the content of the alarm, some alarms are automatically canceled when the alarm condition is removed, but some alarms are not automatically canceled even if the alarm condition is removed. In the latter case, please turn off the power once, remove the cause of the error and turn the power ON again. Reverse protection automatically restarts when the protection condition is removed.

9. Save of measurement data

The data measured while the temperature controlling can be saved into a CSV file.

The screenshot shows a 'Data Acquisition' window with a 'CSV File Name' input field, an 'OPEN' button, 'START' and 'STOP' buttons, and a 'Writing...' indicator. A legend box on the right explains the indicator colors: White for Stop, Yellow for Ready, and Red for Writing. Three numbered callout boxes provide instructions: (1) Click OPEN and specify a file; (2) Click START, with a note that the 'Writing...' icon lights red when saving and yellow when ready; (3) The STOP button stops saving.

Indicator
White: Stop
Yellow: Ready
Red: Writing

(1) Click OPEN button and specify a file

(2) Click START button.
While the temperature controlling, the "Writing..." icon lights in red and the measured data is saved. Otherwise the "Writing..." icon lights in yellow to indicate the standby state.

(3) The STOP button stops saving.

The CSV file is written in the following format:

"Date", "Time", "Measured Temperature", "Preset Temperature", "Sub-Sensor Temperature(*1)", "Alarm Status"

(*1) Written only when the sub-sensor is enabled.

The measurement cycle is 1 second.

Example)

2015/03/11,11:40:53,21.54,5,24.5,GOOD

2015/03/11,11:40:54,21.6,5,24.48,GOOD

2015/03/11,11:40:55,21.53,5,24.51,GOOD

[CAUTION]

If the file specified by clicking OPEN button already exists, the file is initialized and over written. Please note this is not the append mode.

Please make a backup for important files.

10. Troubleshooting

No.	Case	Checkpoint
1	Unable to start this software.	Is the required software installed? (See section "1.Install")
2	Unable to run correctly on the Windows Vista / 7 / 8 / 8.1 / 10 environment. (Unable to start, exit, etc...)	1) Please install in the folder other than "Program Files". 2) Please try to set the Windows XP compatible mode. Please specify the Windows XP compatible mode in the Compatible tab of the properties for this executable file.
3	The communication error is displayed after any operation.	Is the correct COM port number selected? Did you click START button?
4	When inputting the temperature or time, the Out of Range Error message is displayed.	Unable to input the temperature or time with the out of range value. Since the available range is displayed in the error message, please input the value within that range.
5	While running in the Timer or Program mode, the temperature trace chart is not drawn.	If the setting time duration is very long, the chart may be not drawn just after start, because the horizontal (time) scale is so long.
6	Although inputting the value in the temperature profile list, the chart is not drawn.	The chart is not drawn while inputting the value. To update the chart with the inputted temperature profile, please save into a file after inputting the value and open that file again.
7	There are some same scale label in the horizontal axis.	The horizontal scale varies to fit the time span set by user in the Timer mode and Program mode. The horizontal label which is formatted as "Month-Day" and "Hour-Minute" may be identical depending on the setting time.
